Ecotreat Performance Testing

Dear Paul,

Please be advised that we have completed Performance Testing on the Clusia guttifera and the Clusia guttifera “Nana” crops. The testing has demonstrated between a 80 and 95% leaf retention rate and as you will see in the attached photos, the plants are producing and sustaining new growth. These results represent a successful test. Because we could see that the testing was obviously successful and because the nursery deposit hold agreement we had was nearing expiration, we took delivery of all of the Nana's & Gutiffera’s for the order and have commenced Ecotreating these crops (see photos).

We have had the inspectors from the Florida Department of Agriculture here inspecting during the processing and everything Ecotreated so far has been certified as being soil free. We will continue the routine of inspections throughout the Ecotreating of the material and will obtain the final Phytosanitary certificates, demonstrating full compliance with the requirements of the import permit, just prior to shipping. We hope to be able to hold the Ecotreated material here in our care for as long as possible before shipping as such will benefit the material by insuring that it has at least partially re-rooted into the Ecotreat mix before shipping.

I will update further as we progress.

Warm regards;

George P. Nottingham
